

BASIC II, which works under the operating system OS.8 MT, is equally suitable for both technical and administrative applications i.e. calculation process control, data management etc.

### ORIENTATION

<i>Multi-user</i>	Several users working at the same time is a function in OS8MT. The users can work with both program development and application/execution at the same time.
<i>Multitasking</i>	Supervised by OS.8MT several programs can run at the same time. More than one task can be started from the same terminal device. This makes it possible to, for example, control a machine at the same time as running a data base.
<i>Real time</i>	All execution is done in a real time environment, with the possibilities of both time-sharing and giving tasks different priorities. A calendar and a clock are included in OS.8MT. Tasks can also be time-synchronised.
<i>Compiling</i>	Programs are compiled from ASCII-code to an internal BASIC-code containing all the references to variables and instructions. The result is a very fast execution of programs, as all searching is eliminated.

### INPUT/OUTPUT

<i>Peripherals</i>	All I/O is totally independent of the physical characteristics of each device. Any combination of devices can be used as every type is controlled by driver routines contained in OS.8MT. The most common types of peripherals are: Terminals devices: Intelligent and non-intelligent. Printers: Character and line oriented. Mass-storage: Floppy discs, winchesters, hard discs and magnetic tape. Modems: Synchronous and asynchronous. Process control: Analogous and digital inputs and outputs.
<i>Filing system</i>	Totally independent of a chosen combination of mass-storage devices i.e. floppy disc, winchester, etc. One master file directory and any number of element file directories exist on each volume. Files and space for files are allocated and de-allocated in a totally dynamic way.
<i>Files</i>	Every file-type can be reached from BASIC. The record length can be fixed or variable between 1 and 65535 characters, while the files can consist of 1 to 16777215 records. The files can be continuous with fixed size or indexed with variable size. Three access methods exist: on byte-, record- or sector level.
<i>Data bases</i>	Data bases are managed by an ISAM program, which permits several users to work with one or more data bases at the same time. Index-sequential access method with fixed record length is used. Up to 10 indices are allowed in the same data base. While every record can be read, protection is made centrally. As all

indices and keys are updated when writing, no sorting is needed. The data bases can be moved to different mass-storage devices without any limitations.

*Networks* Up to 32 systems can be used together. Both local and central peripherals can be used.

### PROGRAM DEVELOPMENT

<i>Programming</i>	All programming is made in an interactive way with immediate syntax control and error monitoring. Programs are easily structured by using multi-line functions that permits both parameters and results to be transferred. To promote readability loops are tapered when listing a program.
<i>Segmentation</i>	Programs larger than 40 Kb are segmented and later chained together. Variables are transferred between the segments.
<i>Error handling</i>	As every type of error can be handled without stopping the program, very stable application programs can be written.
<i>Debugging</i>	Debugging is made very easy by using TRACE and single step (CTRL-S) functions.

### ADVANCED PROGRAMMING

<i>ISAM</i>	With the aid of special instructions, advanced, multi-user data base systems can be built.
<i>Supervisor calls</i>	Every system function can be reached with supervisor calls. Parameters are transferred using standardised parameter-blocks.
<i>External programs</i>	Programs written in arbitrarily chosen languages can be loaded, started and manipulated from a BASIC-program.
<i>ASSEMBLER-routines</i>	User written ASSEMBLER-routines, loaded by OS.8MT can be called from a BASIC-program.

### PROGRAMMING

<i>Commands</i>	The immediate actions are controlled with 14 commands.
<i>Instructions</i>	68 instructions, most of which can be used as commands, are available. Several instructions on each line are permitted.
<i>Functions</i>	46 functions including user defined functions with the possibility of local variables and recursion.
<i>Data-types</i>	Integers, strings and floating points.
<i>Variables</i>	Long names and multiple dimensions.
<i>Operations</i>	Logical and arithmetical expressions with a precision of up to 126 digits.

### DATA-TYPES

<i>Integers</i>	Between -32768 and 32767 (16 bit)
<i>Floating-points</i>	A precision of 6 digits (32 bit) or 16 digits (64 bit).
<i>Character-strings</i>	No limitation in length.

## VARIABLES

<i>Names</i>	Up to 32 characters long.
<i>Vectors/ matrix</i>	Every data-type can be used with any number of dimensions and chosen intervals for each dimension.

## OPERATIONS

<i>Arithmetic</i>	Exponentiation (**), Multiplication (*), Division (/), Additions (+) and Subtraktion (-).
<i>Logical</i>	AND, EQV, IMP, NOT, OR, XOR.
<i>Relations</i>	=, <>, >, <, >=, <=.
<i>String- arithmetics</i>	A maximum size of 125 characters.

## COMMANDS

<i>RUN</i>	Starts a program.
<i>CONT</i>	Continues program execution.
<i>NEW or SCR</i>	Clears storage.
<i>AUTO</i>	Automatic line numbering.
<i>RENUMBER</i>	Changes the numbering of the lines.
<i>ERASE</i>	Erases one or more lines.
<i>ED</i>	Starts editing of a line.
<i>LOAD</i>	Load a program into the working storage of the computer.
<i>MERGE</i>	Merges program files.
<i>LIST</i>	Lists the program.
<i>SAVE</i>	Saves the program in compiled form.
<i>UNSAVE</i>	Erases a program from a disc.

## DATA-INSTRUCTIONS

<i>LET</i>	Assigns a value to a variable.
<i>READ</i>	Assigns a value from a DATA statement to a variable.
<i>DATA</i>	Assigns values to variables (used with read).
<i>RESTORE</i>	Resets the DATA-pointer.
<i>DIM</i>	Allocates space for strings and vectors.
<i>COMMON</i>	Declares the variables, whose values are to be transferred to another program (CHAIN).
<i>SINGLE</i>	Sets floating-point numbers to single precision (6 digits)
<i>DOUBLE</i>	Sets floating point numbers to double precision (16 digits)
<i>EXTEND</i>	Allows extended variable names to be used.
<i>NO EXTEND</i>	Terminates work in EXTEND-mode.
<i>INTEGER</i>	Sets the input and lists format to integer for variables.
<i>FLOAT</i>	Sets the input and list format to float for variables.
<i>OPTION BASE</i>	Denotes the lowest vector index value.
<i>RANDOMIZE</i>	Sets a start value for the RND function.
<i>SET TIME</i>	Sets date and time.

## PROGRAM-CONTROL STATEMENTS

<i>PAUSE</i>	Pauses the execution of a program.
<i>STOP</i>	Stops the execution of a program.
<i>END</i>	Terminates a program.
<i>BYE</i>	Exits BASIC and gives control to the operating system.
<i>CHAIN</i>	Loads and executes a program from the currently executing program.
<i>DEF FN</i>	Defines a multiple line function.
<i>RETURN</i>	Returns from a subroutine or multiple line function.
<i>FNEND</i>	Terminates a multiple line function.
<i>FOR... TO... STEP</i>	Starts a program loop.
<i>NEXT</i>	Terminates a program loop.
<i>GOSUB</i>	Jump to a subroutine.

<i>ON...</i>	Conditional jump to one of several subroutines.
<i>GOSUB</i>	
<i>GOTO</i>	Jump to a given line number.
<i>ON... GOTO</i>	Conditional jump to one of several lines.
<i>IF... THEN... ELSE</i>	Conditional execution.
<i>WHILE</i>	Specifies condition for the branching out of a program loop.
<i>WEND</i>	Terminates loop.
<i>ON ERROR GOTO</i>	Specifies a routine for error handling.
<i>RESUME</i>	Return from error handling.
<i>ON...</i>	Conditional return from error handling.
<i>RESUME</i>	
<i>ON...</i>	Conditional resetting of the DATA-pointer.
<i>RESTORE TRACE</i>	Prints the line number of the executed program lines.
<i>NO TRACE</i>	Terminates execution in TRACE-mode.

## I/O INSTRUCTIONS

<i>DIGITS</i>	Specifies the number of digits to be printed.
<i>OPTION EUROPE</i>	Specifies the format when using PRINT USING.
<i>INPUT</i>	Fetches data for the current program.
<i>INPUT LINE</i>	Accepts a line of characters.
<i>PRINT</i>	Prints data in ASCII format.
<i>PRINT USING</i>	Prints formatted data.
<i>GET</i>	Reads one or more characters from the keyboard.
<i>PUT</i>	Writes a string variable in binary format.
<i>NAME</i>	Changes the name of a file.
<i>KILL</i>	Deletes a file.
<i>OPEN</i>	Opens a file.
<i>PREPARE</i>	Creates and opens a file.
<i>CLOSE</i>	Closes one or more files.

## MATHEMATICAL FUNCTIONS

<i>ABS(x)</i>	The absolute value of x.
<i>FIX(x)</i>	The truncated value of x.
<i>INT(x)</i>	The greatest integer $\leq x$ .
<i>MOD (x,y)</i>	The remainder of an integer division of the arguments.
<i>PI</i>	The constant 3.14159
<i>RND</i>	A random value between 0 and 0.999999.
<i>SGN(x)</i>	The sign of x.
<i>SQR(x)</i>	The square root of x.
<i>EXP(x)</i>	The value $e^{**}x$ .
<i>LOG(x)</i>	The natural logarithm of x.
<i>LOG10(x)</i>	The common logarithm of x.
<i>ATN(x)</i>	The arctangent of x in radians.
<i>COS(x)</i>	The cosine of x in radians.
<i>TAN(x)</i>	The tangent of x.
<i>HEX\$(x)</i>	The hexadecimal string representation of x.
<i>OCT\$(x)</i>	The octal string representation of x.

## STRING FUNCTIONS

<i>ADD \$</i>	Adds two numerical strings.
<i>DIV \$</i>	Divides two numerical strings.
<i>MUL \$</i>	Multiplicates two numerical strings.
<i>SUB \$</i>	Subtracts two numerical strings.
<i>COMP %</i>	Compares two numerical strings.
<i>NUM \$</i>	Converts a value to a numerical string.
<i>VAL</i>	Converts a numerical string to a value.
<i>ASCII</i>	The ASCII value of the first character of a string.

<i>INSTR</i>	Seaches for the occurrence of one string in another string.
<i>LEN</i>	The length of a string.
<i>MID \$</i>	Returns a part of a string.
<i>LEFT \$</i>	Returns a part of a string.
<i>RIGHT \$</i>	Returns a part of a string.
<i>CHR \$</i>	A string of ASCII values corresponding to the arguments.
<i>SPACE</i>	A string containing spaces.
<i>STRING</i>	A string of ASCII characters.

### REMAINING INSTRUCTIONS AND FUNCTIONS

<i>CUR</i>	Positions the cursor on the screen.
<i>ERRCODE</i>	The latest generated error code.
<i>FN</i>	Calls a user defined function.
<i>REM or !</i>	Inserts comments in the program.
<i>SLEEP,</i>	Delays the execution for a number of seconds.
<i>TAB</i>	Tabulates to a chosen position.
<i>TIME</i>	A string of the current date and time.

### ADVANCED INSTRUCTIONS AND FUNCTIONS

<i>CALL</i>	Calls an assembler program.
<i>CVT</i>	Converts integers and floats to and from binary numbers.
<i>ISAM OPEN</i>	Opens a data base for read and write.
<i>ISAM READ</i>	Reads a record from a data base.
<i>ISAM WRITE</i>	Writes a record and updates the indices.
<i>ISAM UPDATE</i>	Changes a record and updates the indices.
<i>ISAM DELETE</i>	Deletes a post and updates the indices.
<i>OPEN... MODE</i>	Opens a file for access on byte or record level.
<i>PREPARE...</i>	Creates and opens a file.
<i>MODE</i>	
<i>OUT</i>	Writes data to a chosen port.
<i>INP</i>	Reads data from a chosen port.
<i>PEEK</i>	Reads a byte from the primary memory.
<i>PEEK 2</i>	Reads two bytes from the primary memory.
<i>POKE</i>	Loads a byte in the primary memory.
<i>SVC</i>	A call requesting a system resource controlled by OS.8MT.
<i>SWAP %</i>	Returns an integer with the first and second bytes transposed.
<i>SYS</i>	Returns system information like program size etc.
<i>VAROOT</i>	The address of the description of a variable.
<i>VARPTR</i>	The address of a variable.
