

PASCAL working under the operating system OS.8MT, is a powerful language equally suitable for both technical and administrative applications i.e. calculation, process control (the code can be placed in PROM), data management, etc. PASCAL follows the UCSD recommendations.

OS.8MT — ORIENTATION

<i>Multi-user</i>	Several users working at the same time is a function in OS.8MT. The users can work with both program development and application-execution at the same time.
<i>Multitasking</i>	Supervised by OS.8MT several programs can run at the same time. More than one task can be started from the same terminal device. This makes it possible to, for example, control a machine at the same time as running a data base.
<i>Real time</i>	All execution is done in a real time environment, with the possibilities of both time-sharing and giving tasks different priorities. A calender and a clock are included in OS.8MT. Tasks can also be time-synchronised.

INPUT/OUTPUT

<i>Peripherals</i>	All I/O is totally independent of the physical characteristics of each device. Any combination of devices can be used as every type is controlled by driver routines contained in OS.8MT. The most common types of peripherals are: Terminal devices: Intelligent and non-intelligent. Printers: Character and line oriented. Mass-storage: Floppy discs, winchesters, hard discs and magnetic tape. Modems: Synchronous and asynchronous Process control: Analogous and digital inputs and outputs.
<i>Filing system</i>	Totally independent of a chosen combination of mass-storage devices i.e. floppy disc, winchester, etc. Every disc has its own name, independant of the drives. One master file directory and any number of element file directories exist on each volume. Files and space for files are allocated and de-allocated in a totally dynamic way.
<i>Files</i>	Every file-type can be reached from PASCAL. The record length can be fixed or variable between 1 and 65535 characters and the files can consist of 1 to 16777215 records. The files can be contiguous with fixed size or indexed with variable size. Three access methods exist: on byte, record or sector level.
<i>Data bases</i>	Data bases are managed by an ISAM program, which permits several users to work with one or more data bases at the same time. Index-sequential access method with fixed record length is used. Up to 10 indices are allowed in the same data base. While every record can be read, protection is made centrally. As all indices and keys are updated when writing, no sorting is needed. The data bases can be moved to different mass-storage devices without any limitations.
<i>Networks</i>	Up to 32 systems can be used together. Both local and central peripherals can be used.

PROGRAM DEVELOPMENT

<i>Source code</i>	PASCAL source code is prepared with a powerful editor in ASCII-code.
<i>P-code</i>	The source code can be compiled into pseudo-code which is executed with the help of an interpreter.
<i>P-code linking</i>	Modules can be linked together on P-code level.
<i>Object code</i>	The P-code can be compiled into a fast and compact object code.
<i>Multi-language</i>	Tasks can include modules written in different compiling languages.
<i>PROMation</i>	Pascal programs (not including segmented procedures and functions) can be placed in PROM, either by promming the task-code or the P-code and interpreter. This option makes it possible to optimize the size and speed of the program.
<i>Error handling</i>	As every type of error can be handled without stopping the program, very stable application programs can be written.
<i>Debugging</i>	Debugging is made very easy by using TRACE and single step (CTRL-S) functions.

PROGRAMMING TOOLS

<i>System programs</i>	A number of programs are available for compiling, executing, deleting, dumping, linking, interpreting and printing different kinds of files. It is also possible to create P-code libraries and cross reference lists.
<i>Command streams</i>	In CSS (Command String Supervisor)-mode the user can instruct the interpreter to execute powerful CSS-commands in a user-specified file.
<i>Control statements</i>	Defines the actions that a program is to perform on its defined data.
<i>Data types</i>	Integers, floating points, booleans and characters. User defined, structured, pointer and file-data types are available.
<i>Procedures and functions</i>	Accepts user written procedures and functions. A great number of pre-prepared procedures and functions are also available.
<i>Segmentation</i>	Procedures and functions can be segmented.

ADVANCED PROGRAMMING

<i>ISAM</i>	With the aid of special instructions, advanced, multi-user data base systems can be built.
<i>Supervisor calls</i>	Every system function can be reached with supervisor-calls. Parameters are transferred using standardised parameter-blocks.
<i>External programs</i>	Programs written in arbitrarily chosen languages can be loaded, started and manipulated from a PASCAL-program.
<i>ASSEMBLER-routines</i>	User written ASSEMBLER-routines, loaded by OS8.MT, can be called from a PASCAL-program.

SYSTEM PROGRAMS

<i>PASCAL</i>	To execute pre-compiled user programs.
<i>PASSYS</i>	To execute the following system programs.
<i>PASCOMP</i>	To compile text files to P-code.
<i>PASLINK</i>	To link pre-compiled user programs or library modules.
<i>PASOBJ</i>	To convert P-code to object-code.
<i>PASLIB</i>	To create and update a P-code library.
<i>PASCROSS</i>	To create a cross reference list.
<i>PASDEL</i>	To delete files.
<i>PASPRINT</i>	To print text files.
<i>PASDUMP</i>	To dump files.

CSS-MODE

<i>\$-commands</i>	Define the current CSS-mode and are interpreted by the CSS-processor.
<i>\$\$-commands</i>	Control the flow and execution of a CSS-command file. They can also be used to create permanent files and to operate on taskfiles. The <i>\$\$-commands</i> can be used in interactive mode.

CONTROL STATEMENTS

<i>BEGIN...END</i>	A compounded sequence of statements.
<i>Assignments</i>	(), NOT, ★, /, DIV, MOD, AND, +, —, OR, =, <, >, <, >, IN.
<i>WHILE...DO</i>	Executes a statement or compound statement repeatedly until the condition being tested becomes false.
<i>REPEAT...UNTIL</i>	Executes a statement or a list of statements repeatedly until a desired condition is met.
<i>FOR...TO (or DOWNTO)...DO</i>	Executes a simple or compound statement for a predetermined number of times.
<i>IF...THEN...ELSE</i>	Evaluates an expression and chooses between two possible actions.
<i>CASE...OF</i>	Transfers control to one of several statement labels depending on the variable's name.
<i>GOTO</i>	Unconditionally transfers control from one portion of the program to another.

STANDARD DATA TYPES

<i>Integers</i>	Between —32 767 and 32 767.
<i>Floating points</i>	A precision of 6 digits.
<i>BOOLEAN</i>	Logical variables.
<i>Characters</i>	Any symbol from the ASCII-set.

USER DEFINED DATA TYPES

<i>TYPE</i>	A set of constant values which a variable may assume.
<i>SET OF</i>	A collection of values which are all of the same type.

STRUCTURED DATA TYPES

<i>ARRAY...OF</i>	A fixed number of components referenced by the same name.
<i>PACKED ARRAY...OF</i>	An array with minimal memory waste.
<i>STRING</i>	A packed array of characters.
<i>RECORD</i>	A type with a user defined structure that incorporates several components.
<i>PACKED RECORD</i>	A record with minimal memory waste.
<i>WITH...DO</i>	References a record once for one or more field accesses.

POINTER AND FILE DATA TYPES

↑	Declaration of a pointer variable.
<i>TYPE...FILE OF</i>	Defines a record file.
<i>TYPE...TEXT</i>	Defines a text file.
<i>TYPE...FILE</i>	Defines a physical file.
<i>TYPE-ISAM-FILE</i>	Defines an ISAM file.

PROCEDURES AND FUNCTIONS

<i>PROCEDURE</i>	Affects programming situations.
<i>FUNCTION</i>	Returns a value of a specified kind.
<i>FORWARD</i>	Allows functions and procedures to be accessed before they are defined.

STRING INTRINSICS

<i>CONCAT</i>	Concatinates one or more strings together.
<i>COPY</i>	Returns a string copied from another string.
<i>DELETE</i>	Removes characters from a string.
<i>INSERT</i>	Inserts one string into another.
<i>LENGTH</i>	Returns the length of a given string.
<i>POS</i>	Returns the position of the first occurrence of a character sequence within a string.

INPUT/OUTPUT INTRINSICS

<i>BLOCKREAD</i>	Transfers blocks of data from a file to an array and returns the byte count.
<i>BLOCK-WRITE</i>	Transfers blocks of data from an array to a file and returns the byte count.
<i>CLOSE</i>	Closes and deletes files.
<i>EOF</i>	Returns a true value when end of file is reached.
<i>EOLN</i>	Returns a true value when end of line is reached.
<i>GET</i>	Reads data from a file.
<i>INP</i>	Reads data from a port.
<i>IORESULT</i>	Holds the result codes of the I/O operations.
<i>OUT</i>	Writes a value to a port.
<i>PAGE</i>	Sends a page carriage control to a text file.
<i>PUT</i>	Writes data to a file.
<i>READ</i>	Reads data from a file or the keyboard.
<i>READLN</i>	Reads a line of input until the first position of the next line.
<i>RESET</i>	Prepares a file to be read.
<i>REWRITE</i>	Prepares a file to be written.
<i>SEEK</i>	Changes the order in which data is accessed from a file.
<i>WRITE</i>	Outputs variables and strings.
<i>WRITELN</i>	Outputs a line and carriage return.

CHARACTER ARRAY MANIPULATION INTRINSICS

<i>FILLCHAR</i>	Places a character into a array a specified number of times.
<i>MOVELEFT</i>	Moves characters from the left end of one string to the left of another.
<i>MOVERIGHT</i>	As MOVELEFT but in the opposite direction.
<i>SCAN</i>	Finds the distance between a character and a starting point.

MATHEMATICAL FUNCTIONS

<i>ABS</i>	The absolute value of a value.
<i>ARCTAN</i>	The arctangent of a value.
<i>COS</i>	The COS of a value.
<i>EXP</i>	"e" powered to a value.
<i>LN</i>	The natural logarithm of a value.
<i>LOG</i>	The common logarithm of a value.
<i>MOD</i>	The remainder of an integer division of the arguments.
<i>ODD</i>	The BOOLEAN value specifying whether an integer is odd.
<i>ROUND</i>	The integer representation of a REAL number.
<i>SIN</i>	The sine of a value.
<i>SQR</i>	The square of a number.
<i>SQRT</i>	The square root of a number.
<i>TRUNC</i>	The integer representation of the decimal portion of a REAL number.

MISCELLANEOUS ROUTINES

<i>DATE</i>	Gives the current date.
<i>DISPOSE</i>	Returns allocated memory.
<i>EOLCHR</i>	The integer value representing a termination.
<i>EXIT</i>	An orderly exit from a program, function or main program.
<i>GOTOXY</i>	Sends the cursor to specified coordinates.
<i>HALT</i>	Terminates the execution of a PASCAL program.
<i>MARK</i>	Sets a pointer to the current top-of-heap of the available free memory.
<i>NEW</i>	Allocates free memory from the heap.
<i>OPTION</i>	Returns the starting switches.
<i>RELEASE</i>	Sets the pointer to the memory location of the pointer variable.
<i>SIZE OF</i>	Returns the number of bytes in memory that are assigned to an identifier.

<i>STARTPAR</i>	Returns the characters that are written after the code-file name when a program is executed.
<i>SVC</i>	Executes Supervisor calls.
<i>TIME</i>	Returns the time since the system last was booted.

ISAM STATEMENTS AND PROGRAMS

<i>CREINDEX</i>	Allocates and creates an ISAM Index file and its associated data file.
<i>ISAM...DELETE</i>	Removes a particular data record's key from an ISAM index file.
<i>ISAM...READ...</i>	Accesses by key or sequentially, records contained in the data file associated with an ISAM index file.
<i>ISAM...UP-DATE</i>	Replaces a specified record in the ISAM data file.
<i>ISAM...WRITE</i>	Enters a new record into the ISAM data file.
